EXPLORATION & GEOLOGICAL DRILLING BULLETIN 2023

In 2023, CMPDI carried out detailed exploration drilling of 13.82 Lakh meters across coalfields of CIL subsidiaries. Geological investigations confirmed Barakar Formation coal seams as the primary economic horizon with superior coking and non-coking properties.

In SECL Korba Coalfield, Gevra block exhibits thick seam development where Seam Bottom and Seam Top merge to form a composite seam of up to 35 meters thickness. Proved geological reserves in Gevra block stand at 335.3 MT. Raniganj Formation exhibits non-coking coal seams with proved reserves of 24.8 MT in the eastern sector.
